

ABSTRACT OF THE DISCLOSURE

5 A wedge dead end employs a single wedge-shaped jaw
movable in an angled jaw guide between a rearward open position
and a forward gripping position. The single jaw wedge dead end
defines a fixed cable trough generally parallel to a lower gripping
10 surface of the wedge-shaped jaw. When released from its rearward
open position the jaw moves toward its forward gripping position and
into a wedging engagement against a conductor disposed in the cable
trough. Forward movement of the jaw applies gripping force against
the conductor until the full tension of the transmission line is
developed.
